

Group D. Instructions

The code is contained in the files `train.py`, `models.py`, `utils.py`, and `run.py`.

The models can be run from the file `run.py`, where the user can additionally decide between running only the U-Net or running the full GAN implementation. The fraction of each dataset used can also be changed.

`data.py` is responsible for collecting and preparing data

`models.py` contains the tensor flow models

`train.py` contains the training function

`utils.py` contains functions to evaluate the performance of the models

You must additionally install `scikit-learn`, `scipy`, and `matplotlib` in order to use all the code within the CW2 Tensorflow environment.

When running, it is assumed that the directory containing the python files contains a sub-older called "data" containing the NIFTI files for all images and masks.
